

List of changes

header

remove the menu item "unified views" and place it as a logo with link to home on top of the menu instead

place username and login/logout on top of menu in the html structure

tree

use different css classes so I can distinguish First level items, Second level items and Third level items via icons

buttons

use css class "primary" if the button should be blue, otherwise it's silver

use unique classes for buttons that should have an icon like "copy", "delete", "add", etc

action buttons

is it possible to work with css background images instead of having the image in the code itself? So I could implement hover effects. For that every button should have a unique class with its function like "run", "debug" etc

remove the class "v-button" from the action buttons, so only the icon without background is visible

pager

change the html structure of the pager so I can implement the css like in the design

tabs

when there are subtabs like in "DPU templates" > "Template Configuration" I need another html structure or at least a unique class to implement the subtabs (2. level tabs) like in the design

login

I need a unique class for the login container to implement the design

settings

I need a unique class in

```
<div class="v-gridlayout v-layout v-widget v-has-width v-gridlayout-margin-top v-gridlayout-margin-right v-gridlayout-margin-bottom v-gridlayout-margin-left" style="width: 100%; height: 566px;">
```

to give the container a border
